

# MobiVault : Peer FeedBack

During the brainstorming and ideation phase of the MobiVault concept, I shared the initial draft of the app's purpose and features with a peer to gather early feedback.

One of the most insightful comments came from **Ray**, who suggested:

"It would be a great addition if users had the option to sign in using biometrics or a password."

This suggestion aligned strongly with our app's core values of privacy and user control. Based on this feedback, we revised the login/authentication flow to explicitly support both biometric authentication (e.g., fingerprint/face unlock) and a fallback password login. This change improves accessibility while maintaining strong security.

This feedback has been incorporated into:

- The updated app concept description
- The authentication screen in the navigation flow
- The data model (User entity now includes `usesBiometrics` field)
